아동 및 심대에 대한 백신 사용 금지 선별 체크리스트

부모 및 보호자에 대한 설명: 다음의 질문들은 저희가 오늘 휴한 자녀에게 접종할 백신을 결정하는 데 도움이 됩니다. 어떤 질문에 "예"라고 답변하시더라도, 이것이 반드시 자녀에게 백신을 접종할 수 없다는 것을 의미하지는 않습니다. 이것은 단지 추가로 질문을 해야 한다는 것을 의미합니다. 질문이 명확하지 않으면 의료제공자에게 설명해 달라고 요청하십시오.

| 1. 자녀가 오늘 몸이 아不良信息이냐? | □ | □ | □ |
| 2. 자녀가 약, 식품, 백신 성분 또는 라텍스에 대해 알레르기가 있습니까? | □ | □ | □ |
| 3. 자녀가 과거에 어떤 백신에 대해 심한 부작용을 일으킨 적이 있습니까? | □ | □ | □ |
| 4. 자녀에게 폐질환, 심장질환, 신장질환, 신진대사질환(당뇨병 등), 천식 또는 혈액장애와 같은 건강문제가 있었던 적이 있습니까? 자녀가 장기 아스피린 약을 받고 있습니까? | □ | □ | □ |
| 5. 백신을 접종 받을 자녀가 2살에서 4살 사이인 경우, 지난 12개월 동안 의료제공자가 자녀에게 씩근거림 또는 천식이 있다고 말한 적이 있습니까? | □ | □ | □ |
| 6. 자녀가 신생아인 경우, 그 자녀가 장증점종이 있다는 말을 들은 적이 있습니까? | □ | □ | □ |
| 7. 자녀, 형제자매, 또는 부모님이 발작을 일으켰거나, 자녀가 뇌 또는 다른 신경계통 문제를 일으킨 적이 있습니까? | □ | □ | □ |
| 8. 자녀에게 암, 백혈병, HIV/AIDS 또는 다른 면역계통질환이 있습니까? | □ | □ | □ |
| 9. 자녀가 지난 3개월 동안 코디존, 프레드니손, 기타 스테로이드 제제, 또는 항암제와 같은 면역체계를 약화시키는 약물을 복용했거나, 방사선 치료를 받은 적이 있습니까? | □ | □ | □ |
| 10. 자녀가 지난 3개월 동안 혈액 또는 혈액제품을 수혈 받았거나, 면역(갑마) 글로불린 또는 항바이러스제를 투여 받은 적이 있습니까? | □ | □ | □ |
| 11. 자녀 자녀/심대가 현재 임신 중이거나, 다음 달 동안에 임신할 가능성이 있습니까? | □ | □ | □ |
| 12. 자녀가 지난 4주 동안 백신을 접종 받은 적이 있습니까? | □ | □ | □ |

양식 작성자: ____________________________ 날짜: ____________
양식 검토자: ____________________________ 날짜: ____________

자녀의 예방접종 기록카드를 가지고 오셨습니까? 예 □ 아니오 □
자녀의 예방접종 기록을 보관하는 것이 중요합니다. 자녀에 대한 기록이 없으면 의료제공자에게 자녀에게 접종한 모든 백신에 대한 기록을 달라고 요청하십시오. 이 기록은 안전한 장소에 보관하고 자녀가 병원에 갈 때마다 가지고 가십시오. 이 중요한 문서는 자녀가 보육원 또는 학교에 가거나, 취직을 하거나, 해외 여행을 가기 위해 필요합니다.
Information for Health Professionals about the Screening Checklist for Contraindications (Children & Teens)

Are you interested in knowing why we included a certain question on the screening checklist? If so, read the information below. If you want to find out even more, consult the references listed at the bottom of this page.

1. **Is the child sick today?** [all vaccines]

   There is no evidence that acute illness reduces vaccine efficacy or increases vaccine adverse events (1, 2). However, as a precaution with moderate or severe acute illness, all vaccines should be delayed until the illness has improved. Mild illnesses (such as otitis media, upper respiratory infections, and diarrhea) are NOT contraindications to vaccination. Do not withhold vaccination if a person is taking antibiotics.

2. **Does the child have allergies to medications, food, a vaccine component, or latex?** [all vaccines]

   If a person has anaphylaxis after eating gelatin, do not administer MMR, MMRV, or varicella vaccine. Local reactions are not contraindications. For a table of vaccines supplied in vials or syringes that contain latex, go to www.cdc.gov/vaccines/pubs/pinkbook/downloads/appendices/B/Latex-table.pdf. For an extensive list of vaccine components, see reference 3. An egg-free recombinant influenza vaccine (RV) may be used in people age 18 through 49 years with egg allergy of any severity who have no other contraindications. Children and teens younger than age 18 years who have experienced a serious systemic or anaphylactic reaction (e.g., hives, swelling of the lips or tongue, acute respiratory distress, or collapse) after eating eggs should consult a specialist for appropriate evaluation to help determine if vaccine should be administered. Protocols have been published for safely administering influenza vaccine to people with egg allergies (see reference 4). People who report a reaction of only hives after having eaten eggs or egg-containing foods, can receive either inactivated influenza vaccine (IIV) or, if age-eligible, RV (not LAIV). If RV is to be administered, CDC recommends 1) the vaccine be administered by a healthcare provider familiar with the potential manifestations of egg allergy and 2) the vaccine recipient be observed for at least 30 minutes.

3. **Has the child had a serious reaction to a vaccine in the past?** [all vaccines]

   History of anaphylactic reaction (see question 2) to a previous dose of vaccine or vaccine component is a contraindication for subsequent doses (1). History of encephalopathy within 7 days following DTP/DTaP is a contraindication for further doses of pertussis-containing vaccine. Precautions to DTaP (not Tdap) include the following: (a) seizure within 3 days of a dose, (b) pale or limp episode or collapse within 48 hours of a dose, (c) continuous crying for 3 or more hours within 48 hours of a dose, and (d) fever of 105°F (40°C) within 48 hours of a previous dose. There are other adverse events that might have occurred following vaccination that constitute contraindications or precautions to future doses. Under normal circumstances, vaccines are deferred when a precaution is present. However, situations may arise when the benefit outweighs the risk (e.g., during a community pertussis outbreak).

4. **Has the child had a health problem with lung, heart, kidney, or metabolic disease (e.g., diabetes), asthma, or a blood disorder? Is he/she on long-term aspirin therapy?** [LAIV]

   Children with any of the health conditions listed above should not be given the intranasal, live attenuated influenza vaccine (LAIV). These children should be vaccinated with the injectable influenza vaccine.

5. **If the child to be vaccinated is between the ages of 2 and 4 years, has a healthcare provider told you that the child had wheezing or asthma in the past 12 months?** [LAIV]

   Children who have had a wheezing episode within the past 12 months should not be given the live attenuated influenza vaccine. Instead, these children should be given the inactivated influenza vaccine.

6. **If your child is a baby, have you ever been told that he or she has had intussusception?** [Rotavirus]

   Infants who have a history of intussusception (i.e., the telescoping of one portion of the intestine into another) should not be given rotavirus vaccine.

7. **Has the child, a sibling, or a parent had a seizure; has the child had brain or other nervous system problem?** [DTaP, Td, Tdap, TIW, LAIV, MMRV] DTaP and Tdap are contraindicated in children who have a history of encephalopathy within 7 days following DTP/DTaP. An unstable progressive neurological problem is a precaution to the use of DTaP and Tdap. For children with stable neurological disorders (including seizures) unrelated to vaccination, or for children with a family history of seizures, vaccinate as usual (exception: children with a personal or family [i.e., parent or sibling] history of seizures generally should not be vaccinated with MMRV; they should receive separate MMR and VAR vaccines). A history of Guillain-Barré syndrome (GBS) is a consideration with the following: 1) Td/Tdap: if GBS has occurred within 6 weeks of a tetanus-containing vaccine and decision is made to continue vaccination, give age-appropriate Tdap instead of Td if no history of prior Tdap, to improve pertussis protection; 2) Influenza vaccine (IIV or LAIV): if GBS has occurred within 6 weeks of a prior influenza vaccination, vaccinate with IIV if at high risk for severe influenza complications.

8. **Does the child have cancer, leukemia, HIV/AIDS, or any other immune system problem?** [LAIV, MMR, MMRV, RV, VAR]

   Live virus vaccines (e.g., MMR, MMRV, varicella, rotavirus, and the intranasal live, attenuated influenza vaccine [LAIV]) are usually contraindicated in immunocompromised children. However, there are exceptions. For example, MMR is recommended for asymptomatic HIV-infected children who do not have evidence of severe immunosuppression. Likewise, varicella vaccine should be considered for HIV-infected children with age-specific CD4+ T-lymphocyte percentage at 15% or greater and may be considered for children age 8 years and older with CD4+ T-lymphocyte counts of greater than 200 cells/µL. Immunocompromised children should not receive LAIV. Infants who have been diagnosed with severe combined immunodeficiency (SCID) should not be given a live virus vaccine, including rotavirus (RV) vaccine. Other forms of immunosuppression are a precaution, not a contraindication, to rotavirus vaccine. For details, consult the ACIP recommendations (5, 6, 7).

9. **In the past 3 months, has the child taken medications that weaken their immune system, such as cortisone, prednisone, other steroids, or anticancer drugs, or had radiation treatments?** [LAIV, MMR, MMRV, VAR]

   Live virus vaccines (e.g., MMR, MMRV, varicella, LAIV) should be postponed until after chemotherapy or long-term high-dose steroid therapy has ended. For details and length of time to postpone, consult the ACIP statement (1). To find specific vaccination schedules for stem cell transplant (bone marrow transplant) patients, see reference 8. LAIV can be given only to healthy non-pregnant individuals age 2–49 years.

10. **In the past year, has the child received a transfusion of blood or blood products, or been given immune (gamma) globulin or an antiviral drug?** [LAIV, MMR, MMRV, VAR]

    Certain live virus vaccines (e.g., MMR, MMRV, varicella) may need to be deferred, depending on several variables. Consult the most current ACIP recommendations or the current Red Book for the most current information on intervals between antiviral drugs, immune globulin or blood product administration and live virus vaccines (1, 2).

11. **Is the child/teen pregnant or is there a chance she could become pregnant during the next month?** [LAIV, MMR, MMRV, VAR]

    Live virus vaccines (e.g., MMR, MMRV, varicella, LAIV) are contraindicated one month before and during pregnancy because of the theoretical risk of virus transmission to the fetus (1, 7). Sexually active young women who receive a live virus vaccine should be instructed to practice careful contraception for one month following receipt of the vaccine (6, 9). On theoretical grounds, inactivated poliovirus vaccine should not be given during pregnancy; however, it may be given if risk of disease is imminent (e.g., travel to endemic areas) and immediate protection is needed. Use of Td or Tdap is not contraindicated in pregnancy. At the provider’s discretion, either vaccine may be administered during the 2nd or 3rd trimester (10).

12. **Has the child received vaccinations in the past 4 weeks?** [LAIV, MMR, MMRV, VAR, yellow fever]

    If the child was given either live, attenuated influenza vaccine (LAIV) or an injectable live virus vaccine (e.g., MMR, MMRV, varicella, yellow fever) in the past 4 weeks, they should wait 28 days before receiving another vaccination of this type. Inactivated vaccines may be given at the same time or at any spacing interval.
