Thoughts on the final issue of Needle Tips

By Deborah L. Wexler, MD, Editor, Needle Tips

This is your final issue of Needle Tips, the Immunization Action Coalition’s (IAC’s) flagship periodical since 1994. I’ve been involved in every aspect of the 62 issues we’ve published, so I’d like to share with you some history of these 23 years – how Needle Tips began, how it grew over the years, why we are saying goodbye, and what’s next. I would also like to thank some who have been deeply involved for many years in the work of Needle Tips, making it such an inspired, successful, and long-lived publication for readers like you.

How we started…

Needle Tips was preceded by IAC’s main periodical during the early 1990s, the Hepatitis B Coalition News (HBCN). The first issue of Needle Tips was published side-by-side with HBCN, stapled together and mailed to nearly 50,000 healthcare professionals and others throughout the United States.

What’s In This Issue

Thoughts on the final issue of Needle Tips …… 1
Ask the Experts: CDC Answers Your Questions …………… 4
Influenza Educational Materials for Patients and Staff ………………… 7

Products You Can Purchase from IAC ……… 18
IAC’s Immunization Resources Order Form ……… 19

“Shots” appeared on the cover of the premier issue of Needle Tips in 1994, and was written by my children Sarah and Isaac Wexler-Mann.

Following this premier issue, and through 2008, Needle Tips was printed and mailed twice a year to pediatricians, family physicians, pediatric nurse practitioners, school nurses, state and local health departments, and many others, with a circulation of up to 200,000.

According to IAC surveys, the most popular feature of Needle Tips has been its “Ask the Experts” column, where experts from the Centers for Disease Control and Prevention (CDC) provide answers to practical questions about hepatitis B and all other routinely recommended vaccines.

We added a bit of levity to our serious content by sprinkling funny riddles throughout each issue from 1994 until 2009, all of which were illustrated by my artistic children, Sarah, Isaac, and Leo, up until each left for college.

Why we are saying goodbye…

Our main website, www.immunize.org, and our weekly email news service, IAC Express, are better able to keep Needle Tips readers up to date on IAC’s ever-expanding educational content and news. The gap of several months between Needle Tips issues has rendered it too untimely to keep up with today’s fast-changing world of immunization.

Going forward…

Although Needle Tips will be gone, IAC Express will carry on, bringing all Needle Tips content to its readers on a weekly basis. News about recently updated ACIP recommendations, new vaccine licensures, Vaccine Information Statements, and CDC publications will be announced, along with articles about IAC’s free, downloadable CDC-reviewed educational materials for patients and clinic staff (e.g., standing orders templates and handouts for patients). At least five times per year, we will publish special editions of IAC Express that are exclusively “Ask the Experts” Q&As. If you’re not already an IAC Express subscriber, please visit www.immunize.org/subscribe.
Final issue…continued from page 2

Thank you!
Over these 23 years, I have been honored to work closely with so many wise, talented, and dedicated individuals to bring you every issue of Needle Tips. Here are the names of those to whom I am most particularly indebted and about whom I have treasured memories that will never leave me.

CDC’s “Ask the Experts” Hall of Fame

Andrew Kroger, MD, MPH, medical officer at CDC’s National Center for Immunization and Respiratory Diseases (NCIRD), has served since 2012 as IAC’s key Needle Tips contact for providing answers to all “Ask the Experts” questions. To do this, he works with NCIRD’s expert education team members who include medical officers Candide L. Robinson, MD, MPH, and Raymond A. Strikas, MD, MPH, FACP, FIDSA; and nurse educators Donna L. Weaver, RN, MN, and JoEllen Wolicki, BSN, RN. Thank you all for working with us. It has been an honor for me and IAC to collaborate with CDC’s entire education team on Needle Tips.

William L. Atkinson, MD, MPH, medical epidemiologist at NCIRD answered hundreds of “Ask the Experts” questions (sometimes from beaches of Mexico) between 1995 and his retirement in 2012. Fortunately for IAC, Bill is now our associate director for immunization education and continues to coordinate “Ask the Experts” Q&As with the CDC team of experts.

Harold S. Margolis, MD, past director, CDC’s Division of Viral Hepatitis (DVH), devoted long hours over many years (even while on mountaintop camping trip with his family) to answering hepatitis A and B questions for Needle Tips readers until he retired from CDC.

Linda A Moyer, RN, retired chief, Education and Training Team, DVH, likewise devoted many hours for many years to answering “Ask the Experts” hepatitis questions until she retired from CDC in 2006. Following retirement, she became a consultant for IAC and continued to answer “Ask the Experts” questions until she retired in 2015.

IAC staff who are no longer with us

Margaret Vaillancourt, writer and community activist, who started IAC with me in 1991, devoted 10 years to Needle Tips and IAC, providing lots of laughs and boundless energy. Margaret passed away in 2014.

Becky Payne, assistant to the director (me), served as editor, proofreader, finder of riddles, and devoted 14 years to IAC and to keeping watch over many aspects of Needle Tips. We lost our dear Becky to a massive stroke in 2011.

Current IAC staff

Diane Peterson, IAC’s associate director for immunization projects, associate editor, and master organizer has been always ready with the preliminary plan for

Final issue...continued from page 2

Each issue of Needle Tips since she started working at IAC in 2002. Her Needle Tips assignments are completed early so she can move to everything else she works on. Diane’s motto is “Let’s git ‘er dun.”

William L. Atkinson, MD, MPH, in addition to being IAC’s associate director for immunization education, in recent years has joined Diane as associate editor of Needle Tips. He selects and develops “Ask the Experts” questions within days of our needing them, and sends them to Dr. Kroger at NCIRD. Bill completes his work with astonishing efficiency and accuracy. His home base is in Missouri, but we all hope that someday Bill will move to Minnesota.

Kathryn de Boer, IAC’s creative consultant for several years, works wonders at designing the most beautiful pages for displaying Needle Tips content. She makes my job easy and working with her is a joy.

Many more IACers work on Needle Tips, and all have contributed in important ways. Thank you to Teresa Anderson, DDS, MPH; Marian Deegan, JD; Mike Franey, PhD; Sheila Franey, MA; Chrystal Mann; Jane Myers, EdM; Julie Murphy, MA; Casey Pauly; L.J Tan, MS, PhD; Robin VanOss; Pat Vranesich, RN, BSN; and Laurel Wood, MPA.

And, of course, my family

Michael Mann, my dear husband of nearly 40 years who thought up the title Needle Tips, is so easy-going about my schedule and deadlines, and his presence is such a gift to me and our children.

Sarah Wexler-Mann, our first-born child, was IAC’s earliest featured illustrator in Needle Tips. Sarah is now an organic hops and flower-growing farmer, communications director, graphic designer, and mom residing outside of Houston, Minnesota.

Isaac Mann, our second-born and second Needle Tips illustrator – the one who brought Batman and Robin drawings to Needle Tips (and to the Encyclopedia Britannica in 1997) – is now a painter and teacher of master’s level art students. He lives in New York City.

Leo Wexler-Mann, our third-born child, was IAC’s talented riddle illustrator until 2008. Leo has grown up to become a conservatory-trained pianist, composer, piano teacher, and podcaster, and he continues to draw. He also lives in New York City.

Mark Wexler, my father, who died in 2006, founded Medical Arts Press, a printing company in Minneapolis, Minnesota. I am a printer’s daughter. As a child, I spent time learning how to hand set lead type and, to my mother’s horror when she found out, how to hand-feed a printing press. Dad taught me about designing printed pages, the importance of white space, font choice, line spacing, and placement of art. When he received his copies of Needle Tips in the mail, he would send them right back to me, covered with edits and advice so I would get it right in the next issue. Thank you, Dad.

And, finally, our readers

Thank you for reading Needle Tips. You, the front lines of immunization in the U.S., have been our most important audience. Your appreciative words over the years have enhanced our passion for our work. Thanks for writing to us. A sampling of your messages can be read online at www.immunize.org/aboutus/what_ntva.asp. We will miss hearing from you about Needle Tips, but look forward to receiving your messages about IAC Express. Please keep in touch.

Deborah L. Wexler, MD
Executive Director, Immunization Action Coalition
Deborah@immunize.org

Why did the man climb up the chandelier?

Because he was a light sleeper.

Sarah Wexler-Mann, 1994

That’s the way, uh-huh, uh-huh, I like it!
Ask the Experts

The Immunization Action Coalition extends thanks to our experts, medical officers Andrew T. Kroger, MD, MPH; Candice L. Robinson, MD, MPH; Raymond A. Strikas, MD, MPH, FACP, FIDSA; and nurse educators Donna L. Weaver, RN, MN, and JoEllen Wolicki, BSN, RN, all with the National Center for Immunization and Respiratory Diseases at the Centers for Disease Control and Prevention (CDC).

Influenza vaccines

What’s new in the 2017–18 influenza vaccine recommendations?
The 2017–18 ACIP influenza vaccine recommendations were published on August 25, 2017, and are available online at www.cdc.gov/mmwr/volumes/66/rr/pdfs/rr6602.pdf. The new guidance
- Describes the vaccine composition for this season (a change in the A/H1N1 component);
- Discusses recent FDA licensure and labelling changes including • approval of Afluria Quadrivalent (Seqirus) and Flublok Quadrivalent (Protein Sciences);
  • expansion of the age indication for Flulaval Quadrivalent (GSK) to age 6 months and older (previously licensed for people 3 years and older);
  • expansion of the age indication for Afluria (Seqirus) to include persons 5 years and older (previously recommended for persons 9 years and older); and
- Recommends that live attenuated influenza vaccine (LAIV, Flumist; AstraZeneca) not be used during the 2017–18 season.

Which influenza vaccines will be available during the 2017–18 influenza season?
Multiple manufacturers are producing influenza vaccine for the U.S. market for the 2017–18 season. Inactivated vaccines will be produced using egg-based, cell culture–based, and recombinant technologies. Some of the inactivated influenza vaccines will be quadrivalent (containing four strains of influenza virus) rather than trivalent (three strains). LAIV may be available but is not recommended for use during the 2017–18 season. A complete listing of influenza vaccine products is available from the Immunization Action Coalition (IAC) at www.immunize.org/catg.d/p4072.pdf.

Who is recommended to be vaccinated against influenza?
ACIP recommends annual vaccination for all people ages 6 months and older who do not have a contraindication to the vaccine.

When should influenza vaccine be given?
You can begin administering vaccine as soon as it becomes available. Optimally, vaccination should occur before onset of influenza activity in the community. Healthcare providers should offer vaccination by the end of October, if possible, and vaccination activity should continue through the fall and winter months, as long as influenza virus is circulating in the community. Early vaccination of children younger than age 9 years who need 2 doses of vaccine can be helpful in assuring routine second doses are given before the influenza season begins.

When administering influenza vaccine, is giving patients a VIS mandatory or is it only “recommended”?
Giving patients an influenza Vaccine Information Statement (VIS) is mandatory under the National Childhood Vaccine Injury Act of 1986. The VIS must be given to all adults as well as to parents or guardians of children prior to vaccination. Two VISs are available, one for LAIV (although LAIV is not recommended to be used during the 2017–18 season) and one for inactivated influenza vaccine (IV). Each can be found at www.immunize.org/vis along with many translations. The influenza VIS has been modified so that it does not need to be replaced each year. The 2015–16 influenza VIS (used for the past two years) should be used during the 2017–18 season.

Which influenza vaccines can we give to children?
Among the injectable inactivated influenza vaccines, both Fluzone (Sanofi Pasteur) and Flulaval are approved by the FDA for use in children ages 6 through 35 months. There are several inactivated influenza vaccines that can be given to children age 3 years or older.

Please provide details about the use of Flulaval influenza vaccine in children younger than 3 years.
On November 18, 2016, the FDA approved an extension of the age range for quadrivalent Flulaval IIIV to include children 6 through 35 months of age. Flulaval was previously approved for people 3 years of age and older. The approval of the extended age range for Flulaval was based on a study showing an equivalent (“non-inferior”) response compared to children who received the Fluzone pediatric dosage. The vaccine is supplied for this indication in manufacturer-filled syringes and multi-dose vials. The dosage approved for children 6 through 35 months of age is 0.5 mL – the same dosage as for people 3 years of age and older.

Which children younger than age 9 years will need 2 doses of influenza vaccine in this influenza season?
Children age 6 months through 8 years should receive a second dose 4 weeks or more after the first dose 1) if they are receiving influenza vaccine for the first time, 2) if they did not receive a total of at least two doses of trivalent or quadrivalent influenza vaccine before July 1, 2017, or 3) if their vaccination history is unknown. The two doses need not have been received during the same season or consecutive seasons.

IAC’s handout titled “Guide for Determining the Number of Doses of Influenza Vaccine to Give to Children Ages 6 Months Through 8 Years” provides guidance on this issue; it is available at www.immunize.org/catg.d/p3093.pdf.

Can a child 6 through 35 months of age who needs 2 doses of influenza vaccine this season receive one each of Fluzone and Flulaval vaccine?
Yes. Both Fluzone (0.25 mL dose) and Flulaval (0.5 mL dose) are approved by the FDA for use in children 6 through 35 months of age.

If a child receives Fluzone vaccine (0.25 mL) at age 34 or 35 months for the first time and then returns for the second dose at age 37 months, should we give another 0.25 mL dose of Fluzone or should we give the 0.5 mL dose that is indicated for age 3 and older?
The child should always receive the dose appropriate for his or her age at the time of the clinic visit; at age 37 months that would be 0.5 mL.

A 1-year-old was inadvertently given a 0.25 mL dose of Flulaval rather than the recommended 0.5 mL dose. What should we do?
If the error is discovered while the child is still in the office, you can administer the other “half” of the Flulaval dose. If the error is discovered later, the dose should not be counted, and then the child should be recalled to the office and given a full age-appropriate repeat dose, either a 0.5 mL dose of Flulaval or a 0.25 mL dose of Fluzone.

Is influenza vaccine recommended for pregnant women?
Yes. It is especially important to vaccinate pregnant women because of their increased risk for influenza-related complications. An increased risk of severe influenza infection was also observed in postpartum women (those who delivered within the previous 2 weeks) during the 2009–10 H1N1 pandemic. Vaccination can occur in any trimester, including the first. Only inactivated vaccine should be given to pregnant women.

I heard that a recent study suggested an increase in miscarriage among women who received inactivated influenza vaccine. Please provide details.
A CDC-funded study found that women who had been vaccinated early in pregnancy with an influenza vaccine containing the pandemic H1N1 (H1N1pdm09) component and who also had been vaccinated the prior season with an H1N1pdm09-containing influenza vaccine had an increased risk of spontaneous abortion (miscarriage) in the 28
Ask the Experts…continued from page 4

days after vaccination. This study does not quantify the risk of miscarriage and does not prove that influenza vaccine was the cause of the miscarriage. Earlier studies have not found a link between influenza vaccination and miscarriage. There is an ongoing investigation to study this issue further among women who were pregnant and eligible to receive influenza vaccine during the 2012–13 through 2014–15 influenza seasons. Results are anticipated in late 2018 or 2019.

CDC and ACIP have not changed the recommendation for influenza vaccination of pregnant women. It is recommended that pregnant women receive influenza vaccine during any trimester of their pregnancy because influenza poses a danger to pregnant women and the vaccine can prevent influenza in pregnant women.

Please tell me about Fluad, the new influenza vaccine for people age 65 years and older.

In November 2015, FDA licensed Fluch (Seqirus), a trivalent, MF59-adjuvanted inactivated influenza vaccine, for people age 65 years and older. Flad is the first adjuvanted influenza vaccine marketed in the U.S. An adjuvant is a substance added to a vaccine to increase its immunogenicity. The MF59 adjuvant is based on squalene, an oil that occurs naturally in many plants and animals. Flud has been used in Europe since 1997 and is approved in 38 other countries. In contrast to Fluzone High-Dose (Sanofi Pasteur), Flud is a standard-dose vaccine, containing 15 mcg of hemagglutinin per dose.

A study published in 2014 found that the injectable vaccine Fluzone High-Dose protects people age 65 years and older better than standard-dose Fluzone. Does ACIP preferentially recommend use of Fluzone High-Dose for all people age 65 years and older?

Aging decreases the body’s ability to develop a good immune response after getting influenza vaccine, which places older people at greater risk of severe illness from influenza. A higher dose of antigen in the vaccine should give older people a better immune response and therefore provide better protection against influenza. However, despite published evidence of better protection from Fluzone High-Dose when compared to standard-dose Fluzone (N Engl J Med 2014; 371:635–45), ACIP has not stated a preference for this vaccine for people age 65 years and older.

May Fluzone High-Dose or Fluad be administered to patients younger than age 65 years?

No. Fluzone High-Dose and Fluad are licensed only for people age 65 years and older and are not recommended for younger people.

What is the latest ACIP guidance on influenza vaccination and egg allergy?

ACIP revised its guidance on vaccination of people with egg allergy for the 2016–17 season. This guidance did not change for the 2017–18 season. ACIP recommends that people with a history of egg allergy who have experienced only hives after exposure to egg should receive any inactivated influenza vaccine without specific precautions (except a 15-minute observation period for syncope). People who report having had an anaphylactic reaction to egg (more severe than hives) may also receive any age-appropriate influenza vaccine. The vaccine for those individuals should be administered in a medical setting (such as a physician office or health department clinic). Vaccine administration should be supervised by a healthcare provider who is able to recognize and manage severe allergic conditions. Although not specifically recommended by ACIP, providers may prefer to administer an egg-free recombinant vaccine (Flublok; Protein Sciences) for people age 18 years and older with severe egg allergy.

A previous severe allergic reaction to influenza vaccine, regardless of the component suspected to be responsible for the reaction, is a contraindication to future receipt of the vaccine. For a complete list of vaccine components (i.e., excipients and culture media) used in the production of the vaccine, check the package insert (at www.immunize.org/package inserts) or go to www.cdc.gov/vaccines/pubs/pink book/downloads/appendices/B/excipient-table-2.pdf.

For more details about giving influenza vaccine to people with a history of egg allergy, see www.cdc.gov/mmwr/volumes/66/rr/rr6602.pdf, pages 10–12. You also may find the IAC handout “Influenza Vaccination of People with a History of Egg Allergy” helpful (see www.immunize.org/catg.d/p3094.pdf).

Should staff at drive-through influenza vaccination clinics encourage drivers to park and wait for 15 minutes after vaccination to make sure they don’t have a syncopal (fainting) episode?

Yes. Syncope has been reported following vaccination. It is prudent for all persons to be observed for syncope for at least 15 minutes after vaccination.

When removing both pediatric (0.25 mL) and adult (0.5 mL) doses from a multi-dose vial of Fluzone, we can get more than 10 doses from the 5.0 mL vial. Can we continue to remove doses from the vial until it is empty?

No. Only the number of doses indicated in the manufacturer’s package insert should be withdrawn from the vial. For a 5.0 mL vial of Fluzone this is 10 doses. After the maximum number of doses has been withdrawn, the vial should be discarded, even if there is vaccine remaining in the vial and the expiration date has not been reached.

We inadvertently administered intradermal influenza vaccine to a patient who is outside the recommended age range of 18 through 64 years. What should we do now?

Because people younger than age 12 years or older than 65 years are more likely to have skin that is too thin for proper intradermal administration, a dose of Fluzone ID (Sanofi Pasteur) given to a person in these age ranges should be considered invalid, and the patient should be revaccinated. For people age 12 through 17 years, the dose can be counted as valid on the presumption that their skin thickness is similar to someone 18 through 64 years of age.

How should influenza vaccines be stored?

Both IIV and LAIV should be refrigerated at 2° to 8°C (36° to 46°F). Neither vaccine should be frozen.

Some of my patients refuse influenza vaccination because they insist they “got the flu” after receiving the injectable vaccine in the past. What can I tell them?

There are several reasons why this misconception persists:
- Less than 1% of people who are vaccinated with the injectable vaccine develop flu-like symptoms, such as mild fever and muscle aches, after vaccination. These side effects are not the same as having influenza, but people confuse the symptoms.
- Protective immunity doesn’t develop until 1–2 weeks after vaccination. Some people who get vaccinated later in the season (December or later) may be infected with influenza virus shortly afterward. These late vaccinees develop influenza because they were exposed to someone with the virus before they became immune. It is not the result of the vaccination.

Ask the Experts…continued on page 6
Ask the Experts… continued from page 5

For many people, “the flu” is any illness with fever and cold symptoms or gastrointestinal symptoms. If they get any viral illness, they may blame it on flu vaccine or think they got “the flu” despite being vaccinated. Influenza vaccine only protects against certain influenza viruses, not all viruses.

Influenza vaccine is not 100% effective, especially in older persons.

For more information on this topic, go to: www.cdc.gov/flu/professionals/vaccination/effectiveness qa.htm.

Does ACIP recommend one influenza product over another for pregnant women? Pregnant women can receive any inactivated or recombinant influenza vaccine. They should not be given LAIV (FluMist).

If quadrivalent vaccine includes one additional strain, why isn’t it preferred for use over trivalent vaccines?

Two different types of influenza B virus are likely to cause disease during an influenza season, but trivalent influenza vaccines contain only one type of influenza B virus. The quadrivalent vaccine includes both types of B virus. While quadrivalent vaccines may eventually replace trivalent vaccines, during the current season, the quantity of quadrivalent vaccine available may be limited. Consequently, ACIP does not express a preference for use of one type of influenza vaccine over another type (that is, quadrivalent over trivalent) for those for whom more than one type of vaccine is indicated and available.

Sometimes patients age 65 years and older who have received the standard-dose influenza vaccine hear about the high-dose (Fluzone High-Dose) or adjuvanted vaccine (Fluad) and want to receive that, too. Is this okay to administer?

No. ACIP does not recommend that anyone receive more than one dose of influenza vaccine in a season except for certain children age 6 months through 8 years for whom two doses are recommended.

The influenza VIS states that giving pneumococcal conjugate vaccine and inactivated influenza vaccine simultaneously may increase the risk of febrile seizures. Can we continue to give these two vaccines at the same time?

Yes, you can. Some, but not all studies, have reported increased rates of febrile seizures among children, especially those age 12 through 23 months, who received simultaneous vaccination with IIV and pneumococcal conjugate vaccine (PCV13; Pfizer), when compared with children who received these vaccines separately. However, because of the risks associated with delaying either of these vaccines, ACIP does not recommend administering them at separate visits or deviating from the recommended vaccine schedule in any way.

Febrile seizures, occurring in 2% to 5%, of all children, are not uncommon, and they are generally benign. Healthcare providers should be prepared to answer parents’ questions about febrile seizures and fever when discussing vaccinations. Here is a helpful CDC resource: www.cdc.gov/vaccinesafety/Concerns/FebrileSeizures.html.

The pneumococcal conjugate vaccine (PCV13) package insert says that in adults, antibody responses to PCV13 were diminished when given with inactivated influenza vaccine. Does this mean we should not give PCV13 and influenza vaccine at the same visit?

The available data have been interpreted that any changes in antibody response to either of the vaccines’ components were clinically insignificant. The antibody response was only lowered for three components, and ONLY in patients younger than 65 years of age. In this age group, if PCV13 is recommended, it means there is a high risk of invasive pneumococcal disease for those unvaccinated. If PCV13 and influenza vaccine are both indicated and recommended, they should be administered at the same visit. See the PCV13 ACIP recommendations at www.cdc.gov/mmwr/pdf/wk/mm6337.pdf, page 824.

Some of our patients believe that they have had reactions to influenza vaccine in the past and request the dose to be split into 2 doses administered on different days. Is this an acceptable practice?

This is definitely not an acceptable practice. Doses of influenza vaccine (or any other vaccine) should never be split into “half doses.” If a “half dose” is administered, it should not be accepted as a valid dose and should be repeated as soon as possible with a full age-appropriate dose.

Is it acceptable to draw up vaccine into syringes at the beginning of the day? If it isn’t, how much in advance can this be done?

CDC discourages the practice of prefilling vaccine into syringes for several reasons, including:

- The increased possibility of administration and dosing errors,
- The increased risk of inappropriate storage,
- The probability of bacterial contamination since the syringe will not contain a bacteriostatic agent, and
- The probability of reducing the vaccine’s potency over time because of its interaction with the plastic syringe components.

Prefilling vaccine into syringes also violates basic medication administration guidelines, which state that an individual should administer only those medications he or she has prepared and drawn up.

Although pre-drawing vaccine is discouraged, a limited amount of vaccine may be pre-drawn in a mass-immunization clinic setting under the following conditions:

- Only a single type of vaccine (for example, influenza) is administered at the mass-immunization clinic setting,
- Vaccine is not drawn up in advance of its arrival at the mass-vaccination clinic site,
- These pre-drawn syringes are stored at temperatures appropriate for the vaccine they hold,
- No more than 1 vial or 10 doses (whichever is greater) is drawn into syringes, and
- Clinic staff monitor patient flow carefully and avoid drawing up unnecessary doses or delaying administration of pre-drawn doses.

At the end of the clinic day, any remaining vaccine in syringes prefilled by staff should be discarded.

Ask the Experts

About IAC’s Question of the Week

Each week, IAC Express highlights a new, topical, or important-to-reiterate Q&A. This feature is a cooperative venture between IAC and CDC. William L. Atkinson, MD, MPH, IAC’s associate director for immunization education, chooses a new Q&A to feature every week from a set of Q&As prepared by experts at CDC’s National Center for Immunization and Respiratory Diseases.

To find more than 1,000 Ask the Experts Q&As answered by CDC experts, visit www.immunize.org/askexperts

Please encourage your healthcare professional colleagues to sign up to receive IAC Express at www.immunize.org/subscribe.

**Footnotes**

1. IIV3/IIV4 = egg-based trivalent/quadrivalent inactivated influenza vaccine (injectable); where necessary to refer to cell culture-based vaccine, the prefix “cc” is used (e.g., ccIIV3/ccIIV4); RIV3/RIV4 = trivalent/quadrivalent recombinant hemagglutinin influenza vaccine (injectable); aIIV3 = adjuvanted trivalent inactivated influenza vaccine.

2. An administration code should always be reported in addition to the vaccine product code. Note: Third party payers may have specific policies and guidelines that might require providing additional information on their claim forms.

3. Live attenuated influenza vaccine (LAIV4; FluMist) is not recommended by CDC’s Advisory Committee on Immunization Practices for use in the U.S. for the 2017–18 influenza season.

4. Afluria is approved by the Food and Drug Administration for intramuscular administration with the Pharmajet Stratis Needle-Free Injection System for persons age 18 through 64 years.

5. CPT code 90756 was released on July 1, 2017 for implementation on January 1, 2018. Payers may implement the code based on beneficiaries’ needs any time after the code’s release. The CPT Editorial Panel allotted a 6-month period to allow payers adequate time to prepare their systems; however, processing periods for individual payers may accommodate a more abbreviated timeframe.

Technical content reviewed by the Centers for Disease Control and Prevention

www.immunize.org/catg.d/p4072.pdf ∙ Item #4072 (9/17)
Screening Checklist for Contraindications to Inactivated Injectable Influenza Vaccination

1. Is the person to be vaccinated sick today?
   - There is no evidence that acute illness reduces vaccine efficacy
   - People with a moderate or severe illness usually should not be vaccinated until their symptoms have improved. Minor illnesses with or without fever do not contraindicate use of influenza vaccine.
   - Do not withhold vaccination if a person is taking antibiotics.

2. Does the person to be vaccinated have an allergy to a component of the vaccine?
   - All vaccines, including influenza vaccines, contain various components that might cause allergic and anaphylactic reactions.
   - Not all such reactions are related to egg proteins. However, the possibility of a reaction to influenza vaccines in egg-allergic people might be of concern to both the person and vaccine providers.
   - An egg-free recombinant vaccine (RIV) is available for people age 18 and older. ACIP does not state a preference for the use of RIV for egg-allergic people although some providers may choose to administer RIV to their severely egg-allergic patients.
   - Review of studies of IIV and LAIV indicate that severe allergic reactions to egg-based influenza vaccines in persons with egg allergy are unlikely. For the 2017–18 influenza season, ACIP recommends that persons with a history of egg allergy who have experienced only hives after exposure to egg should receive influenza vaccine. Any licensed age-appropriate influenza vaccine (IIV or RIV) may be used. Providers should consider observing all patients for 15 minutes after vaccination to decrease the risk for anaphylaxis.
   - Patients who report having had reactions to egg involving symptoms other than hives, such as angioedema, respiratory distress, lightheadedness, or recurrent vomiting; or who required epinephrine or another emergency medical intervention, may also receive any age-appropriate influenza vaccine (IIV or RIV). The vaccine should be administered in a medical setting (e.g., a health department or physician office). Vaccine administration should be supervised by a healthcare provider who is able to recognize and manage severe allergic conditions.

3. Has the person to be vaccinated ever had a serious reaction to influenza vaccine in the past?
   - Patients reporting a serious reaction to a previous dose of inactivated influenza vaccine should be asked to describe their symptoms. Immediate—presumably allergic—reactions are usually a contraindication to further vaccination against influenza.
   - Fever, malaise, or other systemic signs that do not require further investigation may also receive any age-appropriate influenza vaccine (IIV or RIV) may be used. Providers should consider observing all patients for 15 minutes after vaccination.

4. Has the person to be vaccinated ever had Guillain-Barré syndrome?
   - It is prudent to avoid vaccinating people who are not at high risk for severe influenza complications (see source 3) and who might be of concern to both the person and vaccine providers.

Use These Standing Orders Templates for Administering Influenza Vaccine in Your Healthcare Setting

Download these standing orders and use them “as is,” or modify them to suit your work setting.

Standing Orders for Administering Influenza Vaccine to Adults

Purpose
To reduce morbidity and mortality from influenza by vaccinating all adults who meet the criteria established by the Centers for Disease Control and Prevention’s Advisory Committee on Immunization Practices.

Policy
Where allowed by state law, standing orders enable eligible nurses and other healthcare professionals (e.g., pharmacists) to access the need for vaccination and to vaccinate adults with influenza vaccine without a written order from the healthcare provider.

NOTE: Use attenuated influenza vaccine (AIV, Flublok). It is not recommended by CDC’s Advisory Committee on Immunization Practices for use in the U.S. during the 2017–18 influenza season. Because AIV is not a licensed vaccine that might be available and that some providers might elect to use, for informational purposes, information is made to previous recommendations for its use.

Procedure
1. Assess Adults for Need of Vaccination against Influenza
   - Age appropriate
   - Has immunosuppression (including that caused by medications or HIV)
   - Is pregnant
   - Is 2 through 4 years who has received a diagnosis of asthma or who has experienced wheezing or asthma episodes
   - Has egg allergy
   - Has had a recent diagnosis of Guillain-Barré syndrome
   - Has a close contact of or who provides care for a severely immunocompromised person who requires protective isolation
   - Has asthma
   - Has moderate or severe acute illness with or without fever

2. Screen
   - Ask about the patient
   - Medical receiving
   - Continuous care
   - A distance
   - Risk

3. Document Vaccination
   - Document on the patient’s chart
   - Attach the standing orders
   - Include the date the vaccine was administered
   - Include the manufacturer and lot number
   - Include the vaccine given

4. Prepare to Administer Vaccine
   - For vaccine that is to be administered intramuscularly: choose an area to administer the dose. The site should be the muscle being used in the injection attachment, according to the following chart:

5. Administer Influenza Vaccine
   - According to the criteria and guidance in the table below:

Standing Orders for Administering Influenza Vaccine to Children and Adolescents

Purpose
To reduce morbidity and mortality from influenza by vaccinating all children and adolescents who meet the criteria established by the Centers for Disease Control and Prevention’s Advisory Committee on Immunization Practices (ACIP).

Policy
Where allowed by state law, standing orders enable eligible nurses and other healthcare professionals (e.g., pharmacists) to access the need for vaccination and to vaccinate children and adolescents with influenza vaccine without a written order from the healthcare provider.

NOTE: Use live attenuated influenza vaccine (AIV, Flumist). It is not recommended by CDC’s Advisory Committee on Immunization Practices for use in the U.S. during the 2017–18 influenza season. Because live vaccine is not a licensed vaccine that might be available and that some providers might elect to use, for informational purposes, information is made to previous recommendations for its use.

Procedure
1. Assess Children and Adolescents for Need of Vaccination against Influenza
   - Age appropriate
   - Has immunosuppression (including that caused by medications or HIV)
   - Is pregnant
   - Is 2 through 4 years who has received a diagnosis of asthma or who has experienced wheezing or asthma episodes
   - Has egg allergy
   - Has had a recent diagnosis of Guillain-Barré syndrome
   - Has a close contact of or who provides care for a severely immunocompromised person who requires protective isolation
   - Has asthma
   - Has moderate or severe acute illness with or without fever

2. Screen
   - Ask about the patient
   - Medical receiving
   - Continuous care
   - A distance
   - Risk

3. Document Vaccination
   - Document on the patient’s chart
   - Attach the standing orders
   - Include the date the vaccine was administered
   - Include the manufacturer and lot number
   - Include the vaccine given

4. Prepare to Administer Vaccine
   - For vaccine that is to be administered intramuscularly: choose an area to administer the dose. The site should be the muscle being used in the injection attachment, according to the following chart:

5. Administer Influenza Vaccine
   - According to the criteria and guidance in the table below:

Standing Orders for Administering Influenza Vaccine to Children and Adolescents

www.immunize.org/catg.d/p3074a.pdf

Standing Orders for Administering Influenza Vaccine to Adults

www.immunize.org/catg.d/p3074.pdf

Additional standing orders templates for all routinely recommended vaccines are available at

www.immunize.org/standing-orders
How to Administer Intramuscular, Intradermal, and Intranasal Influenza Vaccines

Intramuscular injection (IM)
Inactivated Influenza Vaccines (IIV), including recombinant hemagglutinin influenza vaccine (RIV), cell culture-based vaccine (ccIIV), and adjuvanted influenza vaccine (aIIV)
1 Use a needle long enough to reach deep into the muscle. Infants age 6 through 11 mos: 1”; 1 through 10 yrs: 1–1¼”, and children and adults 11 years and older: 1–1½”.
2 With your left hand*, bunch up the muscle.
3 With your right hand*, insert the needle at a 90° angle to the skin with a quick thrust.
4 Push down on the plunger and inject the entire contents of the syringe. There is no need to aspirate.
5 Remove the needle and simultaneously apply pressure to the injection site with a dry cotton ball or gauze. Hold in place for several seconds.
6 If there is any bleeding, cover the injection site with a bandage.
7 Put the used syringe in a sharps container.

Intradermal administration (ID)
Inactivated Influenza Vaccine (IIV)
1 Gently shake the microinjection system before administering the vaccine.
2 Hold the system by placing the thumb and middle finger on the finger pads; the index finger should remain free.
3 Insert the needle perpendicular to the skin, in the region of the deltoid, in a short, quick movement.
4 Once the needle has been inserted, maintain light pressure on the surface of the skin and inject using the index finger to push on the plunger. Do not aspirate.
5 Remove the needle from the skin. With the needle directed away from you and others, push very firmly with the thumb on the plunger to activate the needle shield. You will hear a click when the shield extends to cover the needle.
6 Dispose of the applicator in a sharps container.

Intranasal administration (NAS)
Live Attenuated Influenza Vaccine (LAIV)
1 FluMist (LAIV) is for intranasal administration only. Do not inject FluMist.
2 Remove rubber tip protector. Do not remove dose-divider clip at the other end of the sprayer.
3 With the patient in an upright position, place the tip just inside the nostril to ensure LAIV is delivered into the nose. The patient should breathe normally.
4 With a single motion, depress plunger as rapidly as possible until the dose-divider clip prevents you from going further.
5 Pinch and remove the dose-divider clip from the plunger.
6 Place the tip just inside the other nostril, and with a single motion, depress plunger as rapidly as possible to deliver the remaining vaccine.
7 Dispose of the applicator in a sharps container.

NOTE: Live attenuated influenza vaccine (LAIV4; FluMist), is not recommended by CDC’s Advisory Committee on Immunization Practices for use in the U.S. during the 2017–18 influenza season. Because LAIV4 is still a licensed vaccine that might be available and that some providers might elect to use, for informational purposes, reference is made to previous recommendations for its use.

If you’re behind on your shots, you may need these vaccines, too. Check with your provider.

- Chickenpox (varicella)
- Hepatitis A
- Hepatitis B
- MMR (measles, mumps, rubella)
- Tdap (tetanus, diphtheria, pertussis/whooping cough)

If you’re pregnant, you’ll need an additional dose.

Remember: Getting shots is better than getting these diseases. Don’t miss out on everything life has in store for you. Get protected!

Vaccinations for Infants and Children, Age 0–10 Years

Getting your child vaccinated on time will help protect him or her against 15 vaccine-preventable diseases. Ask your child’s healthcare provider if your child is up to date with all recommended vaccines.

<table>
<thead>
<tr>
<th>Vaccine</th>
<th>Is your child up to date?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chickenpox (varicella; Var)</td>
<td>Your child needs 2 doses of chickenpox vaccine. The first dose is given at 12–15 months and the second at 4–6 years.</td>
</tr>
<tr>
<td>Diphtheria, tetanus, and whooping cough (pertussis; DTaP)</td>
<td>Your child needs 5 doses of DTaP vaccine. The first dose is given at 2 months, the second at 4 months, the third at 6 months, the fourth at 15–18 months, and the fifth at 4–6 years.</td>
</tr>
<tr>
<td>Haemophilus influenzae type b (Hib)</td>
<td>Your child needs 3–4 doses of Hib vaccine, depending on the brand of vaccine. The first dose is given at 2 months, the second at 4 months, the third at 6 months (if needed), and the last at 12–15 months.</td>
</tr>
<tr>
<td>Hepatitis A (HepA)</td>
<td>Your child needs 2 doses of hepatitis A vaccine. The first dose is given at age 1 year and the second 6–12 months later.</td>
</tr>
<tr>
<td>Hepatitis B (HepB)</td>
<td>Your child needs 3–4 doses of hepatitis B vaccine, depending on the brand of vaccine. The first dose is given at birth, the second at 1–2 months, the third at 4 months (if needed), and the last at 6–18 months.</td>
</tr>
<tr>
<td>Influenza (Flu)</td>
<td>Everyone age 6 months and older needs influenza vaccination every fall or winter and for the rest of their lives. Some children younger than age 9 years need 2 doses. Ask your child’s healthcare provider if your child needs more than 1 dose.</td>
</tr>
<tr>
<td>Measles, mumps, rubella (MMR)</td>
<td>Your child needs 2 doses of MMR vaccine. The first dose is given at 12–15 months and the second at 4–6 years.</td>
</tr>
<tr>
<td>Meningococcal (MenACWY; MCV4; MenB)</td>
<td>Infants and children age 0–10 years with certain health conditions (such as a non-functioning spleen) need one or both meningococcal vaccines. Talk with your healthcare provider to find out if your child needs meningococcal vaccination.</td>
</tr>
<tr>
<td>Pneumococcal (Prevnar [conjugate vaccine, PCV], Pneumovax [polysaccharide vaccine, PPSV])</td>
<td>Your child needs 4 doses of Prevnar (PCV). The first dose is given at 2 months, the second at 4 months, the third at 6 months, and the fourth at 12–15 months. Some children also need a dose of Pneumovax (PPSV). Ask your child’s healthcare provider if your child needs this extra protection against pneumococcal disease.</td>
</tr>
<tr>
<td>Polio (IPV)</td>
<td>Your child needs 4 doses of polio vaccine (IPV). The first dose is given at 2 months, the second at 4 months, the third at 6–18 months, and the fourth at 4–6 years.</td>
</tr>
<tr>
<td>Rotavirus (RV)</td>
<td>Your child needs 2–3 doses of rotavirus vaccine (RV), depending on the brand of vaccine. The first dose is given at 2 months, the second at 4 months, and the third (if needed) at 6 months.</td>
</tr>

## Immunization Schedule for Preteens and Teens – Now in 7 Languages!

Here’s the link: [www.immunize.org/catg.d/p4020.pdf](http://www.immunize.org/catg.d/p4020.pdf)

IAC’s 1-page immunization schedule for parents of preteens and teens. Download, print, and make copies, then give them to your patients!

### Vaccinations for Preteens and Teens, Age 11–19 Years

Getting immunized is a lifelong, life-protecting job. Make sure you and your healthcare provider keep your immunizations up to date. Check to be sure you’ve had all the vaccinations you need.

<table>
<thead>
<tr>
<th>Vaccine</th>
<th>Do you need it?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chickenpox (varicella; Var)</td>
<td>Yes! If you haven’t been vaccinated and haven’t had chickenpox, you need 2 doses of this vaccine. Anybody who was vaccinated with only 1 dose should get a second dose.</td>
</tr>
<tr>
<td>Hepatitis A (HepA)</td>
<td>Yes! You need 2 doses of hepatitis A vaccine if you would like to be protected from this disease or if you have a risk factor (such as international travel) for hepatitis A. Check with your healthcare provider to find out if you have a risk factor for this vaccine.</td>
</tr>
<tr>
<td>Hepatitis B (HepB)</td>
<td>Yes! This vaccine is recommended for all people age 0-18 years. You need a hepatitis B vaccine series if you have not already received it.</td>
</tr>
<tr>
<td>Haemophilus influenzae type b (Hib)</td>
<td>Maybe. If you haven’t been vaccinated against Hib and have a high-risk condition (such as a non-functioning spleen), you need this vaccine.</td>
</tr>
<tr>
<td>Human papillomavirus (HPV)</td>
<td>Yes! All preteens and teens age 11 and older need a series of doses of HPV vaccine. The vaccine protects against HPV, the most common cause of cervical cancer. It also protects against some other types of cancers, such as cancer of the anus, penis, and throat. HPV vaccine also protects against genital warts.</td>
</tr>
<tr>
<td>Influenza (Flu)</td>
<td>Yes! Everyone age 6 months and older needs annual influenza vaccination every fall or winter and for the rest of their lives.</td>
</tr>
<tr>
<td>Measles, mumps, rubella (MMR)</td>
<td>Yes! You need 2 doses of MMR vaccine if you have not already received them. MMR vaccine is usually given in childhood.</td>
</tr>
<tr>
<td>Meningococcal ACWY (MenACWY; MCV4)</td>
<td>Yes! All preteens and teens need 2 doses of MenACWY vaccine, the first at age 11–12 years and the second at age 16 years. If you are a first-year college student living in a residence hall, you need a dose of MenACWY if you never received it or received it when you were younger than 16. Check with your healthcare provider.</td>
</tr>
<tr>
<td>Meningococcal B (MenB)</td>
<td>Yes! Teens who want to be protected from meningitis type B are recommended to receive 2 doses of MenB vaccine starting at age 16. Teens with certain risk conditions (such as a non-functioning spleen) should be vaccinated also. Ask your healthcare provider if you have a risk factor.</td>
</tr>
<tr>
<td>Pneumococcal (Pneumovax, PPV; Prevnar, PCV)</td>
<td>Maybe. Do you have an ongoing health condition? If so, check with your healthcare provider to find out if you need one or both of the pneumococcal vaccines.</td>
</tr>
<tr>
<td>Polio (IPV)</td>
<td>Yes! You need a series of at least 3 doses of polio vaccine if you have not already received them. Polio vaccine is usually given in childhood.</td>
</tr>
<tr>
<td>Tetanus, diphtheria, and whooping cough (pertussis; Tdap)</td>
<td>Yes! All preteens and teens (and adults!) need a dose of Tdap vaccine, a vaccine that protects you from tetanus, diphtheria, and whooping cough (pertussis). After getting a dose of Tdap, you will need a tetanus-diphtheria (Td) shot every ten years. If you become pregnant, however, you will need another dose of Td during any pregnancy, preferably during the third trimester.</td>

IAC and ACOG’s Immunization Schedule for Pregnant Women – Now in 7 Languages!

IAC and the American College of Obstetricians and Gynecologists created this 1-page immunization schedule for pregnant women. Download, print, and make copies, then give them to your patients!

Vaccinations for Pregnant Women

The table below shows which vaccinations you may or may not need during your pregnancy.

<table>
<thead>
<tr>
<th>Vaccine</th>
<th>Do you need it during your pregnancy?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Influenza</td>
<td>Yes! You need a flu shot every fall (or even as late as winter or spring) for your protection and for the protection of your baby and others around you. It's safe to get the vaccine at any time during your pregnancy.</td>
</tr>
<tr>
<td>Tetanus, diphtheria, whooping cough (pertussis) (Tdap, Td)</td>
<td>Women who are pregnant need a dose of Tdap vaccine (the adult whooping cough vaccine) during each pregnancy, preferably in the early part of the third trimester. It's safe to be given during pregnancy and will help protect your baby against whooping cough in the early months of life when he or she is most vulnerable. After Tdap, you need a Td booster dose every 10 years. Consult your healthcare provider if you haven't had at least 3 tetanus and diphtheria toxoid-containing shots sometime in your life or if you have a deep or dirty wound.</td>
</tr>
<tr>
<td>Human papillomavirus (HPV)</td>
<td>No. This vaccine is not recommended to be given during pregnancy, but if you inadvertently receive it, this is not a cause for concern. HPV vaccine is recommended for all women age 26 or younger, so if you are in this age group, make sure you are vaccinated before or after your pregnancy. The vaccine is given in 2 or 3 doses (depending on the age at which the first dose is given) over a 6-month period.</td>
</tr>
<tr>
<td>Measles, mumps, rubella (MMR)</td>
<td>MMR vaccine is not recommended to be given during pregnancy, but if you somehow do receive it, this is not a cause for concern. At least 1 dose of MMR is recommended for you if you were born in 1957 or later. (And you may need a second dose.*) During your prenatal care, your healthcare provider will test your blood to assess your need for MMR following your delivery. It’s best for you (and any future baby) to receive the protection vaccination provides before trying to become pregnant.</td>
</tr>
<tr>
<td>Varicella (Chickenpox)</td>
<td>No. Varicella vaccine is not recommended to be given during pregnancy, but if you inadvertently receive it, it is not a cause for concern. If you’ve never had chickenpox, never were vaccinated, or were vaccinated but received only 1 dose, it’s best for you (and any future baby) to be protected with the vaccine before trying to become pregnant, or after you’ve completed your pregnancy. The vaccine is given in 2 doses 4–8 weeks apart.</td>
</tr>
<tr>
<td>Hepatitis A (HepA)</td>
<td>Maybe. You need this vaccine if you have a specific risk factor for hepatitis A virus infection* or simply want to be protected from this disease. The vaccine is usually given in 2 doses, 6–12 months apart. If you need to get or continue the HepA vaccine series, it’s safe to do so during pregnancy.</td>
</tr>
<tr>
<td>Hepatitis B (HepB)</td>
<td>Maybe. You need this vaccine if you have a specific risk factor for hepatitis B virus infection* or simply want to be protected from this disease. The vaccine is given in 3 doses, usually over 6 months. If you need to get or continue the HepB vaccine series, it’s safe to do so during pregnancy. It’s important, too, that your newborn baby gets started on his or her hepatitis B vaccination series before leaving the hospital.</td>
</tr>
<tr>
<td>Hib (Haemophilus influenzae type b)</td>
<td>Maybe. Some adults with certain high-risk conditions, for example, lack of a functioning spleen, need vaccination with Hib. If you need to get Hib vaccine, it’s safe to receive it at any time during your pregnancy.</td>
</tr>
<tr>
<td>Meningococcal ACWY (MenACWY, MCV4)</td>
<td>Maybe. You may need MenACWY vaccine if you have one of several health conditions,* for example, if you don’t have a functioning spleen. You need MenACWY if you’re age 21 or younger and a first-year college student living in a residence hall and you either have never been vaccinated or were vaccinated only 1 dose, it’s best for you (and any future baby) to be protected with the vaccine before trying to become pregnant, or after you’ve completed your pregnancy.</td>
</tr>
<tr>
<td>Meningococcal B (MenB)</td>
<td>Maybe. You should consider MenB vaccine if you are age 23 or younger (even if you don’t have a high-risk medical condition). You may need MenB if you have one of several health conditions,* for example, if you do not have a functioning spleen. Because no studies have been conducted on MenB vaccine in pregnant women, your healthcare provider will need to determine if the benefits of vaccination are considered to outweigh the potential risks.</td>
</tr>
<tr>
<td>Pneumococcal (Pneumovax, PPV, Prevnar, PCV)</td>
<td>Maybe. You need 1 or both of these vaccines if you have a certain risk factor* for pneumococcal disease, for example, diabetes (but not gestational diabetes). If you’re unsure of your risk, talk to your healthcare provider to find out if you need either of these vaccines. If you are a candidate for either pneumococcal vaccine, it’s safe to get it during pregnancy.*</td>
</tr>
</tbody>
</table>

* Consult your healthcare provider to determine your level of risk for infection and your need for this vaccine. Are you planning to travel outside the United States? Visit the Centers for Disease Control and Prevention’s (CDC) website at wwwnc.cdc.gov/travel/destinations/list for travel information, or consult a travel clinic.

Vaccinations for Adults

You’re never too old to get vaccinated!

Getting vaccinated is a lifelong, life-protecting job. Don’t leave your healthcare provider’s office without making sure you’ve had all the vaccinations you need.

<table>
<thead>
<tr>
<th>Vaccine</th>
<th>Do you need it?</th>

</thead>
<tbody>
<tr>
<td>Hepatitis A (HepA)</td>
<td>Maybe. You need this vaccine if you have a specific risk factor for hepatitis A virus infection or simply want to be protected from this disease. The vaccine is usually given in 2 doses, 6–12 months apart.</td>
</tr>
<tr>
<td>Hepatitis B (HepB)</td>
<td>Maybe. You need this vaccine if you have a specific risk factor for hepatitis B virus infection or simply want to be protected from this disease. The vaccine is given in 3 doses, usually over 6 months.</td>
</tr>
<tr>
<td>Hib (Haemophilus influenzae type b)</td>
<td>Maybe. Some adults with certain high-risk conditions, for example, lack of a functioning spleen, need vaccination with Hib. Talk to your healthcare provider to find out if you need this vaccine.</td>
</tr>
<tr>
<td>Human papillomavirus (HPV)</td>
<td>Maybe. You need this vaccine if you are a woman age 26 or younger or a man age 21 or younger. Men age 22 through 26 with a risk condition also need vaccination. Any man age 22 through 26 who wants to be protected from HPV may receive it, too. The vaccine is usually given in 3 doses over a 6-month period.</td>
</tr>
<tr>
<td>Influenza</td>
<td>Yes! You need a dose every fall (or winter) for your protection and for the protection of others around you.</td>
</tr>
<tr>
<td>Measles, mumps, rubella (MMR)</td>
<td>Maybe. You need at least 1 dose of MMR vaccine if you were born in 1957 or later. You may also need a second dose.</td>
</tr>
<tr>
<td>Meningococcal ACWY (Men-ACWY, MCV4)</td>
<td>Maybe. You may need MenACWY vaccine if you have one of several health conditions, for example, if you don’t have a functioning spleen. You need MenACWY if you are age 21 or younger and a first-year college student living in a residence hall and you either have never been vaccinated or were vaccinated before age 16.</td>
</tr>
<tr>
<td>Meningococcal B (MenB)</td>
<td>Maybe. You should consider MenB vaccine if you are age 23 or younger (even if you don’t have a high-risk medical condition). You may need MenB if you have one of several health conditions, for example, if you do not have a functioning spleen.</td>
</tr>
<tr>
<td>Pneumococcal (Pneumovax; PPsv; Prevnar, PCV)</td>
<td>Maybe. If you are age 65 (or older), you need both pneumococcal vaccines, Prevnar (if you haven’t had it before) and Pneumovax. Get Prevnar first and then get Pneumovax 1 year later. If you are younger than age 65 and have a certain high-risk condition (for example, asthma, heart, lung, or kidney disease, immunosuppression, or lack of a functioning spleen, or are a smoker), you need 1 or both vaccines. Talk to your healthcare provider to find out if you need this vaccine.</td>
</tr>
<tr>
<td>Tetanus, diphtheria, whooping cough (pertussis)</td>
<td>Yes! Adults who have not received a dose of Tdap during their lifetime need to get Tdap (the adult whooping cough vaccine). And, all women need to get a dose during each pregnancy. After that, you need a Td booster dose every 10 years. Consult your healthcare provider if you haven’t had at least 3 tetanus and diphtheria toxoid-containing shots sometime in your life or if you have a deep or dirty wound.</td>
</tr>
<tr>
<td>Varicella (Chickenpox)</td>
<td>Maybe. If you’ve never had chickenpox, you were vaccinated, or were vaccinated but received only 1 dose, talk to your healthcare provider to find out if you need this vaccine.</td>
</tr>
<tr>
<td>Zoster (shingles)</td>
<td>Maybe. If you are age 60 or older, you should get a 1-time dose of this vaccine now.</td>
</tr>
</tbody>
</table>

* Consult your healthcare provider to determine your level of risk for infection and your need for this vaccine.

These products are available for purchase from the Immunization Action Coalition

Laminated child/teen and adult immunization schedules –
Order one of each for every exam room

► In March 2018, visit www.immunize.org/shop to order these schedules. Watch for an announcement in IAC Express in March about their release!

Coming in 2018! The ACIP/AAP/AAFP-approved immunization schedule for people ages 0 through 18 years (8-sided) and the ACIP/AAFP/ACOG/ACNM-approved schedule for adults (8-sided). Both are laminated and washable for heavy-duty use, complete with essential footnotes, and printed in color for easy reading.

Wallet-sized immunization record cards for all ages:
For children and teens, for adults, and for a lifetime!

Record Cards: $45/box (includes shipping) Give all your patients a permanent vaccination record card designed specifically for their age group: child and teen, adult, or lifetime. These brightly colored cards are printed on durable rip-, smudge-, and water-proof paper. Each box contains 250 cards.

► To order, visit www.immunize.org/shop, or use the order form on page 19.
Quantity discounts are available. To receive sample cards, contact us: admininfo@immunize.org

Training Video: “Immunization Techniques – Best Practices with Infants, Children, and Adults”

Order your copy of the California Department of Public Health, Immunization Branch's award-winning training video, “Immunization Techniques: Best Practices with Infants, Children, and Adults.” The 25-minute DVD can be used to train new employees and to refresh the skills of experienced staff on administering injectable, oral, and nasal-spray vaccines to children, teens, and adults.

► To order, visit www.immunize.org/shop, or use the order form on page 19.
For healthcare settings in California, contact your local health department immunization program for a free copy.

SIXTH EDITION

Free App from IAC!
Visit the iTunes App Store and download the mobile app today.

Purchase The Vaccine Handbook (592 pages) from IAC at www.immunize.org/vaccine-handbook. For more information, see page 19.
$34.95 + shipping - Discount pricing available.
Order Essential Immunization Resources from IAC

Immunization record cards give healthcare professionals a way to help patients maintain a permanent record of their vaccinations. Having one’s own vaccination record is handy for patients when they enter daycare, kindergarten, or college; change healthcare providers; or travel abroad. The Immunization Action Coalition offers three record cards: child and teen, adult, and lifetime. Each is designed for a specific age group and lists all vaccines recommended for people in that age group. Sized to fit in a wallet, each is brightly colored to stand out and is printed on durable rip-, smudge-, and water-proof paper. To order record cards or any of our other essential immunization resources, print out and mail or fax the form below, or place your order online at www.immunize.org/shop.

It’s convenient to shop IAC online at www.immunize.org/shop
