Vaccinations for Adults
You’re never too old to get immunized!

Getting immunized is a lifelong, life-protecting job. Don’t leave your healthcare provider’s office without making sure you’ve had all the vaccines you need.

**Vaccinations for Adults with HIV Infection**

Vaccines used for people with HIV (HIV+ adults) are the same as used for people without HIV. Most people with HIV are HIV naïve. For those who are not, the Centers for Disease Control and Prevention (CDC) recommends that they get the same vaccines as those with HIV. People with HIV should be encouraged to get vaccinated against HPV if they are age 26 years or younger.

**Vaccinations for Adults with Heart Disease**

People with heart disease get the same vaccines as those without heart disease. Those who are at increased risk for Hib disease because they do not have a functioning spleen should receive 2 doses of MenACWY separated by 3 months. If you are at increased risk for Hib disease because you do not have a functioning spleen, you should receive 2 doses of MenACWY separated by 3 months.

**Vaccinations for Men Who Have Sex with Men**

Vaccines used for men who have sex with men are the same as used for people without性 with men. Those who are at increased risk for Hib disease because they do not have a functioning spleen should receive 2 doses of MenACWY separated by 3 months.

**Vaccinations for Adults with Lung Disease**

Vaccines used for people with lung disease are the same as used for people without lung disease. Those who are at increased risk for Hib disease because they do not have a functioning spleen should receive 2 doses of MenACWY separated by 3 months.

**Vaccinations for Adults with Hepatitis C Infection**

Vaccines used for people with Hepatitis C infection (HCV+ adults) are the same as used for people without Hepatitis C infection. Those who are not, the Centers for Disease Control and Prevention (CDC) recommends that they get the same vaccines as those with Hepatitis C infection. People with HCV should be encouraged to get vaccinated against HPV if they are age 26 years or younger.

**Vaccinations for Adults with Diabetes**

Vaccines used for people with diabetes are the same as used for people without diabetes. Those who are at increased risk for Hib disease because they do not have a functioning spleen should receive 2 doses of MenACWY separated by 3 months.

**Vaccinations for Adults without a Spleen**

Vaccines used for people without a spleen are the same as used for people with a spleen. Those who are at increased risk for Hib disease because they do not have a functioning spleen should receive 2 doses of MenACWY separated by 3 months.
