**Questionnaire de dépistage des contre-indications à la vaccination des enfants et adolescents**

À l’attention des parents/tuteurs : les questions ci-dessous nous aideront à déterminer quels vaccins votre enfant peut recevoir aujourd’hui. Si vous répondez « oui » à l’une des questions, cela ne signifie pas forcément que votre enfant ne devrait pas être vacciné(e). Cela indique simplement qu’il faudra approfondir la question. Si une question n’est pas claire, demandez des explications à votre prestataire de soins.

1. L’enfant est-il/elle malade aujourd’hui ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

2. L’enfant présente-t-il/elle des allergies à certains médicaments, aliments, composants vaccinaux ou au latex ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

3. L’enfant a-t-il/elle déjà eu une réaction grave suite à un vaccin ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

4. L’enfant a-t-il/elle un problème de santé à long terme au niveau des poumons, du cœur, des reins ou une maladie métabolique (p. ex., diabète), de l’asthme, une maladie sanguine, une absence de rate, une carence d’un constituant du complément, un implant cochléaire ou une fuite de liquide céphalo-rachidien ? L’enfant suit-il/elle un traitement par l’aspirine à long terme ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

5. Si l’enfant à vacciner est âgé(e) de 2 à 4 ans, un prestataire de soins vous a-t-il signalé que l’enfant avait une respiration sifflante ou de l’asthme au cours des 12 derniers mois ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

6. Si votre enfant est un nourrisson, à votre connaissance, a-t-il/elle déjà présenté une invagination ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

7. L’enfant, ses frères/sœurs ou l’un de ses parents ont-ils présenté des convulsions ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

8. L’enfant a-t-il/elle été vacciné(e) au cours des 4 dernières semaines ?
   - oui [□]
   - non [□]
   - je ne sais pas [□]

Il est important d’avoir un dossier personnel des vaccinations de votre enfant. Si vous n’avez pas de carnet de vaccination, demandez à votre prestataire de soins de santé de vous en donner un et d’y noter toutes les vaccinations que l’enfant a déjà reçues. Gardez ce carnet de vaccination sûr et apportez-le avec vous à chaque visite médicale de votre enfant. Votre enfant aura besoin de recevoir ce document important tout au long de sa vie, que ce soit pour son admission à un service de garde d’enfants ou à l’école, pour son travail ou pour les voyages à l’étranger.
Information for Healthcare Professionals about the Screening Checklist for Contraindications to Vaccines (Children and Teens)

Are you interested in knowing why we included a certain question on the screening checklist? If so, read the information below. If you want to find out even more, consult the references in Notes below.

1. Is the child sick today? [all vaccines]
   There is no evidence that acute illness reduces vaccine efficacy or increases vaccine adverse events. However, as a precaution with moderate or severe acute illness, all vaccines should be delayed until the illness has improved. Mild illnesses (such as otitis media, upper respiratory infections, and diarrhea) are NOT contraindications to vaccination. Do not withhold vaccination if a person is taking antibiotics.

2. Does the child have allergies to medications, food, a vaccine component, or latex? [all vaccines]
   An anaphylactic reaction to latex is a contraindication to vaccines that contain latex as a component or as part of the packaging (e.g., vial stoppers, prefilled syringe plungers, prefilled syringe caps). If a person has anaphylaxis after eating gelatin, do not administer vaccines containing gelatin. A local reaction to a prior vaccine dose or vaccine component, including latex, is not a contraindication to a subsequent dose or vaccine containing that component.

3. Has the child had a serious reaction to a vaccine in the past? [all vaccines]
   History of anaphylactic reaction (see question 2) to a previous dose of vaccine or vaccine component is a contraindication for subsequent doses. History of encephalopathy within 7 days following DTP/DTaP is a contraindication for further doses of pertussis-containing vaccine. There are other adverse events that might have occurred following vaccination that constitute contraindications or precautions to future doses. Under normal circumstances, vaccines are deferred when a precaution is present. However, situations may arise when the benefit outweighs the risk (e.g., during a community pertussis outbreak).

4. Does the child have a long-term health problem with lung, heart, kidney, or metabolic disease (e.g., diabetes), asthma, a blood disorder, no spleen, complement component deficiency, a cochlear implant, or a spinal fluid leak? Is he/she on long-term aspirin therapy? [MMR, MMRV, LAIV, VAR]
   A history of thrombocytopenia or thrombocytopenic purpura is a precaution to MMR and MMRV vaccines. The safety of LAIV in children and teens with lung, heart, kidney, or metabolic disease (e.g., diabetes), or a blood disorder has not been established. These conditions, including asthma in children ages 5 years and older, should be considered precautions for the use of LAIV. Children with functional or anatomic asplenia, complement deficiency, cochlear implant, or CSF leak should not receive LAIV. Children on long-term aspirin therapy should not be given LAIV; instead, they should be given IV. Aspirin use is a precaution to VAR.

5. If the child to be vaccinated is 2 through 4 years of age, has a healthcare provider told you that the child had whooping or asthma in the past 12 months? [LAIV]
   Children ages 2 through 4 years who have had a wheezing episode within the past 12 months should not be given LAIV. Instead, these children should be given IV.

6. If your child is a baby, have you ever been told that he or she has had intussusception? [Rotavirus]
   Infants who have a history of intussusception (i.e., the telescoping of one portion of the intestine into another) should not be given rotavirus vaccine.

7. Has the child, a sibling, or a parent had a seizure; has the child had brain or other nervous system problem? [DTaP Td, Tdap, IV, LAIV, MMRV]
   DTaP and Tdap are contraindicated in children who have a history of encephalopathy within 7 days following DTaP/DTaP. An unstable progressive neurologic problem is a precaution to the use of DTaP and Tdap. For children with stable neurologic disorders (including seizures) unrelated to vaccination, or for children with a family history of seizures, vaccinate as usual (exception: children with a personal or family (i.e., parent or sibling) history of seizures generally should not be vaccinated with MMRV; they should receive separate MMR and VAR vaccines). A history of Guillain-Barré syndrome (GBS) is a consideration with the following: 1) If GBS has occurred within 6 weeks of a Tetanus-containing vaccine and decision is made to continue vaccination, give Tdap instead of TD if no history of prior Tdap; 2) Influenza vaccine (IV or LAIV): If GBS has occurred within 6 weeks of a prior influenza vaccination, vaccinate with IV if at high risk for severe influenza complications.

8. Does the child have cancer, leukemia, HIV/AIDS, or any other immune system problem? [LAIV, MMR, MMRV, RV, VAR]
   Live virus vaccines (e.g., MMR, MMRV, VAR, RV, LAIV) are usually contraindicated in immunocompromised children. However, there are exceptions. For example, MMR is recommended for asymptomatic HIV-infected children who do not have evidence of severe immune suppression. Likewise, VAR should be considered for HIV-infected children age 12 months through 8 years with age-specific CD4+ T-lymphocyte percentage at 15% or greater, or for children age 9 years or older with CD4+ T-lymphocyte counts of greater than or equal to 200 cells/mL. VAR should be administered (if indicated) to persons with isolated humoral immunodeficiency. Immunosuppressed children should not receive LAIV. Infants who have been diagnosed with severe combined immunodeficiency (SCID) should not be given a live virus vaccine, including RV. Other forms of immunosuppression are a precaution, not a contraindication, to RV. For details, consult ACIP recommendations (see references in Notes above).

9. Does the child have a parent, brother, or sister with an immune system problem? [MMR, MMRV, VAR]
   MMR, VAR, and MMRV vaccines should not be given to a child or teen with a family history of congenital or hereditary immunodeficiency in first-degree relatives (i.e., parents, siblings) unless the immune competence of the potential vaccine recipient has been clinically substantiated or verified by a laboratory.

10. In the past 3 months, has the child taken medications that affect the immune system such as prednisone, other steroids, or anticancer drugs; drugs for the treatment of rheumatoid arthritis, Crohn’s disease, or psoriasis; or had radiation treatments? [LAIV, MMR, MMRV, VAR]
   Live virus vaccines (e.g., LAIV, MMR, MMRV) should be postponed until after chemotherapy or long-term high-dose steroid therapy has ended. For details and length of time to postpone, consult the ACIP statement. Some immune modulator and immune modulator drugs (especially the antineoplastic factor agents aludirimid, infiniumab, and etanercept) may be immunosuppressive. A comprehensive list of immunosuppressive immune modulators is available in CDC Health Information for International Travel (the “Yellow Book”) available at wwwnc.cdc.gov/travel/yellowbook/2020/travelers-with-additional-concerns/infections-and-immunocompromised-travelers. The use of live vaccines should be avoided in persons taking these drugs. To find specific vaccination schedules for stem cell transplant (bone marrow transplant) patients, see General Best Practice Guidelines for Immunization (referenced in Notes above). LAIV, when recommended, can be given only to healthy non-pregnant people ages 2 through 49 years.

11. In the past year, has the child received a transfusion of blood or blood products, or been given immune (gamma) globulin or an antiviral drug? [MMR, MMRV, VAR]
   Certain live virus vaccines (e.g., MMR, MMRV, VAR) may need to be deferred, depending on several variables. Consult the most current ACIP recommendations (referenced in Notes above) for the most current information on intervals between antiviral drugs, immune globulin or blood product administration and live virus vaccines.

12. Is the child/teen pregnant or is there a chance she could become pregnant during the next month? [HPV, IPV, LAIV, MenB, MMR, MMRV, VAR]
   Live virus vaccines (e.g., MMR, MMRV, VAR, LAIV) are contraindicated one month before and during pregnancy because of the theoretical risk of virus transmission to the fetus. Sexually active young women who receive a live virus vaccine should be instructed to practice careful contraception for one month following receipt of the vaccine. On theoretical grounds, IPV and MenB should not be given during pregnancy; however, it may be given if there is a risk of exposure. IV and Tdap are both recommended during pregnancy. HPV vaccine is not recommended during pregnancy.

13. Has the child received vaccinations in the past 4 weeks? [LAIV, MMR, MMRV, VAR, yellow fever]
   Children who were given either LAIV or an injectable live virus vaccine (e.g., MMR, MMRV, VAR, yellow fever) should wait 28 days before receiving another vaccination of this type (30 days for yellow fever vaccine). Inactivated vaccines may be given at the same time or at any spacing interval.

VACCINE ABBREVIATIONS

- LAIV = Live attenuated influenza vaccine
- IPV = Human poliovirus vaccine
- VAR = Varicella vaccine
- MMR = Measles, mumps, and rubella vaccine
- MMRV = MMR+VAR vaccine
- HPV = Human papillomavirus vaccine
- RIV = Rotavirus vaccine
- CRT = Cerebrospinal fluid
- VAR = Varicella vaccine
- TIV = Inactivated influenza vaccine
- TVP = Tetanus, diphtheria, and pertussis vaccine
- Tdap = Tetanus, diphtheria, and pertussis vaccine
